

ASDA technology

Project Manager

I manage people to define and deliver the pieces of the overall jigsaw, both in country and abroad.

This includes providing short and long term plans to ensure you deliver what was agreed, on time and to budget.

I'm responsible for communicating to various stakeholders throughout a project.

Cyber Security Specialist

I review solutions to ensure they meet Asda security standards & present no risk to our data.

I sort and prioritise any security incidents including suspicious emails.

I also help promote the Cyber Security message across Asda.

Developer

Sometimes known as a computer programmer, I play a key role in the design, and creation of in-house software.

The applications we build are typically mobile or web based, and provide our Customers with a better experience.

We also build apps for Colleagues to help them be more efficient and provide better service.

Business Engagement Manager

I collect great ideas from people around Asda and try to understand how Technology can help.

We have to understand how much it's going to cost, if it fits in with our business plan and how long it's going to take to deliver.

Once all of that is understood, we put a team together to make it happen!

IT Solution Architect

Using business requirements, I assess the potential impact of design changes before a project starts.

I usually come up with a few design options first, and propose the best solution to be taken forward.

I need to make sure that, what we design, is the right solution from both a business and technology perspective.

Business Analysis Manager

I work with the business to understand the need for software and how they plan to use it.

I document requirements to ensure that the new or enhanced software supports the need.

I communicate the requirements to software developers to make sure they understand what is required and can then build the software to meet the business need.
